# BROADCAST TIME DELAY

## TSS-2470

### SIMPLE **BROADCAST TIME DELAY**

The TSS-2470 is 360 Systems latest model of Broadcast Time Delay, offering HD and SD compatibility and frame accurate delay. Built with RAID 5 storage, redundant critical components and a space saving 1U chassis, the TSS-2470 maintains the quality and reliability customers expect from 360 Systems.

With its set-and-forget user interface, time zone differences can be easily compensated for without the need for manual recording and rebroadcasting. Simply enter the desired delay time and click run. The input feed is automatically delayed the set amount of time without any further user inputs required.

The TSS-2470 features high-quality 10 bit video with up to 16 channels of embedded audio and support for closed captions and other VANC data. A live feed monitor output and frame accurate delay from 30 seconds to more than 24 hours round out an excellent standard feature set.

### ADVANCED **SOFTWARE FEATURES**

- HDSDI, SDDSI compatibility
- Configurable for 29.97/59.94 or 25/50 fps operation
- Frame accurate delay from 30 sec. to 24 hrs.
- Closed caption / VANC data support
- High quality 10 bit video and 24 bit audio support
- Up to 16 channels of embedded audio
- Intuitive graphical interface
- Simple set and forget design
- Dependable Linux® based OS

### RELIABLE **HARDWARE PERFORMANCE**

- Redundant cooling and power
- RAID 5 protected storage
- Space saving 1U chassis design
- Live feed monitor and delayed outputs
